unipro

Success story

The Challenge

Montagu Evans, a prominent consultancy firm faced significant operational inefficiencies due to manual workflow processes. These processes slowed scalability, hindered efficiency, and created a dependency on external resources for application development and maintenance.

Additionally, they required seamless integration with a legacy data analytics platform to enhance their business intelligence and management information capabilities.

The Solution

Following an in-depth consultancy process, Montagu Evans appointed Unipro to address these challenges, with a comprehensive hybrid / low-code implementation, to deliver the following:

- **Collaborative Workshops:** conduct sessions with stakeholders to map manual workflows, define integration points, and align on priorities
- **Low-Code Environment Setup:** establish development environments and prepared datasets for application builds
- **Application Development:** develop an HR onboarding application, following a comprehensive Proof of Concept, and Prototype development proving the low-code environment as most suitable, with document management, approval workflows, and e-signature functionality
- **Data Integration:** connect new applications to the legacy data platform, enabling robust BI and MI reporting
- **Developer Training:** deliver structured training sessions to upskill the in-house team and ensure long-term self-sufficiency

The Results

The implementation of low-code solutions transformed the organisation by streamlining operations, enhancing scalability, and empowering the in-house development team to independently manage and grow their application portfolio.
